

Remarks

Reconsideration of this Application is respectfully requested.

Upon entry of the foregoing amendment, claims 1, 5-13, 18 and 20-29 are pending in the application, with claim 1 being the independent claim. Claims 2-4, 14-17, and 19 are sought to be cancelled without prejudice to or disclaimer of the subject matter therein. New claims 20-29 are sought to be added. Claim 1 has been amended to be directed to Applicants' elected peptides and to clarify the claimed invention. New claims 20-29 depend from claim 1 and are each directed to one of Applicants' elected peptides. Support for claim 1 and new claims 20-29 can be found, *inter alia*, at ¶ 41 and Tables 11-18. Claims 5-9 have been amended to clarify the claimed invention. Support for amended claims 5 and 6 can be found, *inter alia*, at ¶ 69. Support for amended claims 7 and 9 can be found, *inter alia*, at ¶ 98. Support for amended claim 8 can be found, *inter alia*, at ¶ 73. Claim 13 has been amended to be directed to Applicants' elected antigen. These changes are believed to introduce no new matter, and their entry is respectfully requested.

Based on the above amendment and the following remarks, Applicants respectfully request that the Examiner reconsider all outstanding objections and rejections and that they be withdrawn.

Objection to the Oath/Declaration

The Examiner has objected to the Oath/Declaration of April 5, 2005, citing that non-initialed and/or non-dated alterations have been made to the oath or declaration. (Office Action, ¶ 6, Page 3.) Applicants note that the Declaration submitted to the U.S.

Receiving Office upon filing of the corresponding International Application did not contain any such alterations. Applicants are resubmitting herewith a copy of the Declaration as originally submitted.

It appears that the alterations in the scanned version of the Declaration on the PAIR system were made to the document by USPTO personnel subsequent to the submission of the Declaration by Applicants. Applications respectfully request that the Examiner consider the resubmitted Declaration, which does not contain any alterations, and withdraw the outstanding objection.

Objection to the Abstract

The Examiner has objected to the abstract of the disclosure. (Office Action, ¶ 8, Page 3.) Applicants have amended herewith the abstract of the disclosure. Accordingly, Applicants respectfully request that the Examiner reconsider and withdraw the outstanding objection.

Objections to the Specification

The Examiner has objected to the specification because it does not provide sequence identifiers for the peptide sequences of \geq four (4) amino acid residues in length pursuant to 37 C.F.R. § 1.821 (c) and/or (d), for example, in Tables 5, 6, and 11-29. (Office Action, ¶ 9, Page 3.)

Applicants have submitted herewith replacement pages for Tables 11-29 that include sequence identifiers as required by 37 C.F.R. §§ 1.821 (c) and/or (d).

Applicants have also submitted herewith replacement pages for Tables 5 and 6. Applicants note that the amino acids listed in Tables 5 and 6 refer to amino acids that can be present in the alternative at certain anchor residue positions (p1=position 1; p4=position 4; and p6=position 6) of an HLA-DR core motif for the HLA alleles DR supertype, DR3a or DR3b. The amino acids are referred to by their standard single letter designations. As an example, for the DR3 supertype, the anchor residues at position (p1) can be, in the alternative, a leucine (L), an isoleucine (I), a valine (V), a methionine (M), a phenylalanine (F), a tryptophan (W), or a tyrosine(Y). All of the amino acids listed in Tables 5 and 6 are alternative amino acids at the positions indicated according to the designation described above.

In order to clarify that these amino acids are present in the alternative at the positions indicated, Applicants have amended Tables 5 and 6 to include a comma between each amino acid. Because the amino acids in Tables 5 and 6 correspond to individual amino acids, they are not peptide sequences of ≥ 4 amino acid residues in length, and thus no corresponding sequence identifier is required pursuant to 37 C.F.R. §§ 1.821 (c) and/or (d).

The Examiner has further objected to the legend of Figure 1 because it does not recite the sequence identifiers for the anchor residues having \geq four (4) amino acid residues shown in Figure 1. (Office Action, ¶ 10, Page 3.) Applicants note that the amino acids shown in Figure 1, similar to those shown in Tables 5 and 6, refer to amino acids that can be present in the alternative at the designated anchor residue positions, and thus refer to single amino acids, rather than a peptide sequence having \geq four (4) amino

acid residues. Applicants have amended the figure legend to Figure 1 herewith to clarify this.

Accordingly, based on the above amendments to the specification, Applicants respectfully request that the Examiner reconsider and withdraw the outstanding objections.

Rejections under 35 U.S.C. § 112, second paragraph

Claims 1, 3-15 and 18 have been rejected under 35 U.S.C. § 112, second paragraph, as allegedly being indefinite for failing to particularly point out and distinctly claim the subject matter which Applicants regard as their invention. (Office Action, ¶ 11, Page 3.)

The Examiner has alleged that claims 1, 3-15 and 18 are indefinite for reciting "peptides" because in claim 1 it is not clear what the metes and bounds of the size of the peptide is. (Office Action, ¶ 11a, Page 3.) Without acquiescing to the Examiner's rejection and solely in efforts to expedite prosecution, Applicants have amended claim 1 to clarify the claimed invention. Applicants assert that the claims as amended are clear as to the invention's metes and bounds.

The Examiner has also alleged that in claims 3 and 5, the phrase "HTL epitope" is not defined by the claims or in the specification, and it is not clear what the metes and bounds of the phrase are with respect to the overall composition. (Office Action, ¶ 11b, Page 3.) Without acquiescing to the Examiner's rejection and solely in efforts to expedite prosecution, Applicants note that claim 3 has been cancelled. Applicants also assert that the phrase "HTL epitope" is clear from the specification. The specification

discloses that HTL refers to "helper T lymphocyte" and describes peptide fragments that activate such helper T lymphocytes:

MHC molecules are classified as either class I or class II. Class II MHC molecules are expressed primarily on activated lymphocytes and antigen-presenting cells. CD4+ T lymphocytes are activated with recognition of a unique peptide fragment presented by a class II MHC molecule, usually found on an antigen presenting cell like a macrophage or dendritic cell. Often known as *helper T lymphocytes (HTL)*, CD4+ lymphocytes proliferate and secrete cytokines that either support an antibody-mediated response through the production of IL-4 and IL-10 or support a cell-mediated response through the production of IL-2 and IFN- γ .

(Specification, ¶ 2 (emphasis added).) The specification further describes that the unique peptide fragment presented by a class II MHC molecule is an "epitope" of the native antigen:

The MHC-binding peptides identified herein represent epitopes of a native antigen. With regard to a particular amino acid sequence, an epitope is a set of amino acid residues which is recognized by a particular antibody or T cell receptor. Such epitopes are usually presented to lymphocytes via the MHC-peptide complex. An epitope retains the collective features of a molecule, such as primary, secondary and tertiary peptide structure, and charge, that together form a site recognized by an antibody, T cell receptor or MHC molecule.

(Specification, ¶ 35.) In addition, the specification describes that "[o]ne embodiment of an HTL-inducing peptide is less than 50 residues in length and usually consist of between about 6 and about 30 residues, more usually between about 12 and 25, and often between about 15 and 20 residues, for example 15, 16, 17, 18, 19, or 20 residues."

(Specification, ¶ 41.) Specific examples, of such HTL-inducing peptides are disclosed, for example, in Tables 23-27. Thus, as shown above, the specification clearly sets forth

what is meant by the phrase "HTL epitope" and discloses specific examples of such HTL epitopes. Without acquiescing to the Examiners rejection and solely in efforts to expedite prosecution, Applicants have amended claim 5 to clarify the metes and bounds of the phrase with respect to the overall composition.

The Examiner has further alleged that claims 3-5 and 8 are indefinite because it is not clear how the HTL and CTL epitope and the MHC targeting sequences are related to the peptides of claim 1. (Office Action, ¶ 11c, Page 3.) Without acquiescing to the Examiner's rejection, Applicants have cancelled claims 3 and 4. Applicants note that the limitation of claim 4 has been incorporated into amended claim 1. Applicants have amended claims 5 and 8 to clarify the relationship of the HTL epitope and the MHC targeting sequence to the peptides of claim 1.

The Examiner has further alleged that claims 1, 6, 7 and 9 are indefinite as to how the "spacer molecule" (Claim 6), "carrier" (Claim 7) and "lipid" (Claim 9) relate to the peptides of the composition of claim 1. (Office Action, ¶ 11d, Page 3.) Without acquiescing to the Examiner's rejection, Applicants have amended claims 6, 7, and 9 to clarify the relationship of the spacer molecule, carrier and lipid to the peptides of claim 1.

The Examiner has also alleged that claims 11 and 12 are indefinite because the terms "heteropolymer" and "homopolymer" are not defined in the specification, and it is not clear what the metes and bounds of the terms are with respect to the overall composition. (Office Action, ¶ 11e, Page 3.) The specification states that peptide(s) of the invention may be:

. . . linked to its own carrier or as a homopolymer or heteropolymer of active peptide units. Such a polymer has the advantage of increased immunological reaction and, where different peptides are used to make up the polymer, the additional ability to induce antibodies and/or CTLs that react with different antigenic determinants of the virus or tumor cells.

(Specification, ¶ 98.) Thus, the specification discusses that the units of a homopolymer or heteropolymer are the peptides of the invention. Furthermore, the terms "homo" and "hetero" are clear on their face, and would be clearly understood by one of ordinary skill in the art to mean "same" and "different," respectively. Thus, one of ordinary skill in the art would understand that a "homopolymer" is made up of the same polymer units, and a "heteropolymer" is made up of different polymer units. In view of the specification describing that the units of such polymers are individual peptides of the invention, it can be readily understood from the specification that the meaning of "homopolymer" is a polymer with each unit composed of the same peptide, whereas a "heteropolymer" is a polymer with units composed of different peptides.

In view of the discussion above, Applicants respectfully assert that the pending claims comply with the requirements of 35 U.S.C. § 112, second paragraph. Accordingly, Applicants respectfully request that the Examiner reconsider and withdraw the outstanding rejections.

Rejections under 35 U.S.C. § 112, first paragraph

Claims 3-5, 8, 11 and 12 are rejected under 35 U.S.C. § 112, first paragraph, as allegedly failing to comply with the enablement requirement. (Office Action, ¶ 12, Page 6.) Applicants respectfully disagree and traverse the rejection.

As an initial matter, without acquiescing to the Examiner's rejection and solely in efforts to expedite prosecution, Applicants have cancelled claims 3 and 4. As discussed further below, Applicants assert that claims 5, 8, 11 and 12 are enabled.

The Examiner has alleged that

The specification does not show that any of the elected peptides has any of the claimed functional properties, namely, CTL-induction, HTL-induction or MHC targeting. The specification does not provide a single working example for any one of the elected peptides demonstrating that the peptide has one or more of the claimed functional properties in a relevant bioassay or animal model.

(Office Action, Page 7, ¶ 12.)

"As concerns the breadth of a claim relevant to enablement, the only relevant concern should be whether the scope of enablement provided to one skilled in the art by the disclosure is commensurate with the scope of protection sought by the claims." MPEP § 2164.08 (2006) (citing *AK Steel Corp. v. Sollac*, 344 F.3d 1234, 1244 (Fed. Cir. 2003); *In re Moore*, 439 F.2d 1232, 1236 (C.C.P.A. 1971); *see also Plant Genetic Sys., N.V. v. DeKalb Genetics Corp.*, 315 F.3d 1335, 1339 (Fed. Cir. 2003).

Applicants note that the pending claims, as indicated by the Examiner, are directed to a *composition* comprising one or more peptides selected from the peptides of SEQ ID NOs: 53, 55, 139, 502, 527, 627, 673, 807, 846 and 859. (Office Action, ¶ 12, Page 6, "Nature of the Invention.") Applicants point out that the claims do not require any further limitations. Although the Examiner refers to the "claimed" functional properties of the elected peptides, Applicants again note that the claims are only directed to a composition comprising one or more of the elected peptides and do not recite any further claimed features.

Moreover, as long as the specification discloses at least one method for making and using the claimed invention that bears a reasonable correlation to the entire scope of the claim, then the enablement requirement of 35 U.S.C. § 112 is satisfied. *In re Fisher*, 427 F.2d 833, 839, 166 USPQ 18, 24 (CCPA 1970). Additionally, "a specification disclosure which contains a teaching of the manner and process of making and using the invention . . . must be taken as in compliance with the enabling requirement of the first paragraph of § 112 unless there is reason to doubt the objective truth of the statements contained therein which must be relied upon for enabling support." *Rasmusson v. Smithkline Beecham Corp.*, 413 F.3d 1318, 1323 (Fed. Cir. 2005) (quoting *In re Marzocchi*, 439 F.2d 220, 223 (C.C.P.A. 1971)).

Applicants assert that the specification discloses how to make and use compositions comprising the elected peptides and how to test these compositions for binding affinity using various assays. (Specification, ¶ 55-59.) The specification also discloses how to test these compositions for inhibition of CTL or HTL recognition using purified MHC molecules and radioiodinated peptides and/or cells by immunofluorescent staining and flow microfluorometry, or peptide-dependent class I assembly assays. (Specification, ¶ 77.) The specification also discusses the use of mutant mammalian cell lines to test for the capacity of compositions comprising a particular peptide to induce *in vitro* primary CTL responses. (Specification, ¶ 78.) Additionally, the specification discloses how such compositions can be made. (See Specification, ¶ 61-75.)

Thus, as discussed above, the specification not only discloses how to make and use compositions comprising Applicants' elected peptides, the specification also teaches how to assay the efficacy of such compositions and determine whether the particular

peptides have the capacity to bind to certain MHC molecules and/or have the ability to induce an immune response. Thus, the specification discloses "at least one method for making and using the claimed invention that bears a reasonable correlation to the entire scope of the claim."

The purpose of the requirement that the specification describe the invention in such terms that one skilled in the art can make and use the claimed invention without undue experimentation (*i.e.*, the enablement requirement) is to ensure that the invention is communicated to the interested public in a meaningful way. Here, Applicants respectfully assert that the information contained in the disclosure of the specification is sufficient to inform those skilled in the relevant art how to both make and use the claimed invention in a manner that satisfies the requirements of 35 U.S.C. § 112, first paragraph for enablement.

Finally, the Examiner cites several documents referring to the "inherent risks associated with T-cell immunogenic peptides in general." (Office Action, ¶ 12, Pages 7-9.) The fact that experimentation may be complex does not necessarily make it undue, if the art typically engages in such experimentation. *In re Certain Limited-Charge Cell Culture Microcarriers*, 221 USPQ 1165, 1174 (Int'l Trade Comm'n 1983), *aff'd. sub nom.*, *Massachusetts Institute of Technology v. A.B. Fortia*, 774 F.2d 1104, 227 USPQ 428 (Fed. Cir. 1985). See also *In re Wands*, 858 F.2d at 737, 8 USPQ2d at 1404. Here Applicants respectfully assert that not only is no experimentation necessary to practice the claimed invention, but even if any experimentation was performed it would not be undue as it would be of the type typically engaged in by artisans in this art.

Claims 14 and 15 are rejected under 35 U.S.C. § 112, first paragraph, as allegedly failing to comply with the enablement requirement. (Office Action, ¶ 13, Page 6.) Without acquiescing to the Examiner's rejection and solely in efforts to expedite prosecution, Applicants have cancelled claims 14 and 15. The rejections of these claims has therefore been rendered moot. Accordingly, Applicants respectfully request that the Examiner reconsider and withdraw the outstanding rejection.

Other Matters

Applicants note that the Examiner has indicated that Applicants' elected peptides (SEQ ID NOs: 53, 55, 139, 502, 527, 627, 673, 807, 846 and 859) are free of the prior art.

Conclusion

All of the stated grounds of objection and rejection have been properly traversed, accommodated, or rendered moot. Applicants therefore respectfully request that the Examiner reconsider all presently outstanding objections and rejections and that they be withdrawn. Applicants believe that a full and complete reply has been made to the outstanding Office Action and, as such, the present application is in condition for allowance. If the Examiner believes, for any reason, that personal communication will expedite prosecution of this application, the Examiner is invited to telephone the undersigned at the number provided.

Prompt and favorable consideration of this Amendment and Reply is respectfully requested.

Respectfully submitted,

STERNE, KESSLER, GOLDSTEIN & FOX P.L.L.C.

usually consists of about 8, 9, 10 or 11 residues, preferably 9 or 10 residues. In one embodiment, HLA-DR3 a binding is characterized by an L, I, V, M, F or Y residue at position 1 and a D or E residue at position 4. In another embodiment, HLA-DR3 b binding is characterized by an L, I, V, M, F, Y or A residue at position 1, a D, E, N, Q, S or T residue at position 4, and a K, R or H residue at position 6. In another embodiment, key anchor residues of a DR supertype binding motif are an L, I, V, M, F, W or Y residue at position 1 and an L, I, V, M, S, T, P, C or A residue at position 6. See table 5.

Moreover, in another embodiment, murine Db binding is characterized by an N residue at position 5 and L, I, V or M residue at the C-terminal position. In yet another embodiment, murine Kb binding is characterized by a Y or F residue at position 5 and an L, I, V or M residue at the C-terminal position. In an additional embodiment, murine Kd binding is characterized by a Y or F residue at position 2 and an L, I, V, or M residue at the C-terminal position. In a further embodiment, murine Kk binding is characterized by an E or D residue at position 2 and an L, I, M, V, F, W, Y or A residue at the C-terminal position. In a further embodiment, murine Ld binding is characterized by a P residue at position 2 and an L, I, M, V, F, W or Y residue at the C-terminal position. See Table 6.

The peptides present in the invention can be identified by any suitable method. For example, peptides are conveniently identified using the algorithms of the invention described in the co-pending U.S. Patent Application Serial No. 09/894,018. These algorithms are mathematical procedures that produce a score which enables the selection of immunogenic peptides. Typically one uses the algorithmic score with a binding threshold to enable selection of peptides that have a high probability of binding at a certain affinity and will in turn be immunogenic. The algorithm are based upon either the effects on MHC binding of a particular amino acid at a particular position of a peptide or the effects on binding MHC of a particular substitution in a motif containing peptide.

Peptide sequences characterized in molecular binding assays and capture assays have been and can be identified utilizing various technologies. Motif-positive sequences are identified using a customized application created at Epimmune. Sequences are also identified utilizing matrix-based algorithms, and have been used in conjunction with a "power" module that generates a predicted 50% inhibitory concentration (PIC) value. These latter methods are operational on Epimmune's HTML-based Epitope Information System (EIS) database. All of the described methods are viable options in peptide sequence selection for IC₅₀ determination using binding assays.

Additional procedures useful in identifying the peptides of the present invention generally follow the methods disclosed in Falk *et al.*, *Nature*
